MEDICAL REPORT

Diagnosis:

- Right sinus lesion excised in Athens Ygia Clinic 15/09/2021 – histology demonstrated benign lesion, possible low grade sarcoma
- Branch of trigeminal nerve involved and was excised
- MRI 03/01/2022 showed recurrence of lesion with extension approaching right orbit. Awaiting for further imaging and treatment.

Dear Colleague,

I reviewed [redacted] in clinic today who unfortunately informed me of recurrence of the growth in the right sinus and the plan for further treatment. He is attending for an ophthalmic examination as part of the planning for his treatment.

On examination, best-corrected Snellen visual acuity was right eye 6/7.5 and left eye 6/5. Colour vision (Ishihara 17/17), pupillary responses and ocular motility were symmetrical and normal. There was no exophthalmos (22-116-22). There is mild right upper eyelid retraction, possibly due to damage to a branch of the facial nerve. There was bilateral lid margin disease for which he is receiving treatment.

The right conjunctival vessels appeared more dilated and tortuous in comparison to the left eye. This suggests possible right orbital congestion. The intraocular pressure was 15mmHg in either eye. Syringing of the lacrimal gland showed right acquired nasolacrimal duct obstruction (reflux from upper punctum clear fluid), the left lacrimal system was patent.

Funduscopy showed healthy optic nerves with no pallor or oedema. The remaining of the funduscopy was unremarkable.

Should you require any further information or investigations (formal visual fields/OCT) please do not hesitate to contact us.

Kind Regards
Dr Antigoni Koukkoulli
