**TRANRECTAL ULTRASOUND GUIDED PROSTATE BIOPSIES**

Mr

**Diagnosis:** 1. PSA- 8.8  
2. MRI- PIRADS 5  
3. Open transvesical prostatectomy 2019  
4. DRE- T2

The above gentleman underwent transrectal ultrasound guided prostate biopsies today under local periprostatic block (10ml 1% lidocaine) with antibiotic cover (iv gentamicin and oral ciprofloxacin and metronidazole) and fleet enema.

On rectal examination there was a T2 feeling prostate on the left

The prostate is heterogenous with no discrete hypoechoic area in the peripheral zone. There is an excellent prostatectomy channel.

The prostate was estimated at 58cc

Eight ultrasound guided systematic biopsies were obtained

There were no immediate complications

I shall review him with the results of the biopsy

Yours Sincerely

Mr Chryssanthos Kouriefs BM BCh MSc MRCS FRCS Urol
