9/11/22

MRI OF THE PELVIS-PROSTATE

The examination was conducted on Achieva Philips scan 1,5 Tesla with T2WFSE, DWI and THRIVE sequences in axial, coronal and sagittal orientation before and after intravenous contrast administration

Clinical history of Ca Prostate after biopsy at 20/10/22

The prostatic gland is mildly enlarged in size, measuring 4,6x3,9x3,8cm (volume 34ml), and showing a small upwards protrusion

Multinodular appearance of the prostatic parenchyma with indistinct differentiation of the transitional and peripheral zones

The prostatic capsule appears intact, with no signs of extracapsular invasion

Normal appearance of the seminal vesicles, of the periprostatic and pericolic fat

The urine bladder shows smooth wall thickness

No pathologically enlarged pelvic or inguinal lymph nodes are detected

Dr George Vorkas
Radiologist
